Hosting and Deployment

[React Application Architecture]

✓ YUN_MATSUURA_PROJECT

> backend

> frontend

[React Application Architecture]

✓ backend ●

✓ data

{ } users.json

> node_modules ●

✓ routes

JS allusers.js

JS home.js

JS signin.js

JS signup.js

✓ utilities

JS userStorage.js

⚙ .env

{ } package-lock.json

{ } package.json

JS server.js

[React Application Architecture]

```

  ✓ frontend
    > node_modules
    > public
    ✓ src
      ✓ components
        JS LoginForm.js
        JS SignupForm.js
      ✓ pages
        JS Home.js
```

```

  ✓ src
    > components
    > pages
    # App.css
    JS App.js
    # index.css
    JS index.js
    logo.svg
    JS reportWebVitals.js
    JS setupTests.js
```

```

  ⚙ .env
  🔍 .gitignore
  {} package-lock.json
  {} package.json
```

[Frontend Routing]

```
function App() {  
  return (  
    <BrowserRouter>  
      <Routes>  
        <Route path="/" element={<LoginForm />} />  
        <Route path="/signup" element={<SignupForm />} />  
        <Route path="/home" element={<Home />} />  
      </Routes>  
    </BrowserRouter>  
  );  
}
```

App.js has Routing
No nested or dynamic routing

[Frontend Routing]

useState :

to manage data of the login user on sign up, sign in

```
function LoginForm() {  
  const [inputEmail, setInputEmail] = useState("");  
  const [inputPassword, setInputPassword] = useState("");
```

```
<input  
  id="emailInput"  
  type="email"  
  required  
  value={inputEmail}  
  onChange={(e) => setInputEmail(e.target.value)}  
/>
```

[Frontend Routing]

useNavigate : signIn/signUp => home

```
const navigate = useNavigate();
```

```
navigate("/home", { state: { user: data.user } });
```

[Frontend Routing]

useLocation :
to receive user info from LoginForm/SignupForm

```
function Home() {  
  const location = useLocation();  
  const [users, setUsers] = useState([]);  
  const [showUsers, setShowUsers] = useState(false);  
  
  const user = location.state?.user;
```

```
  navigate("/home", { state: { user: data.user } });
```

[Frontend Routing]

useState :

setUsers : fetched data of all users

setShowUsers : true/false to show all users

```
function Home() {  
  const location = useLocation();  
  const [users, setUsers] = useState([]);  
  const [showUsers, setShowUsers] = use  
  
  const user = location.state?.user;  
  
  try {  
    const response = await fetch(  
      `${process.env.REACT_APP_URL}/home/all-users`  
    );  
    const data = await response.json();  
    setUsers(data);  
    setShowUsers(true);  
  } catch (e) {  
    console.error("Falied to fetch users");  
  }  
}
```

[Node-Express Server Overview]

✓ backend

✓ data

| {} users.json

> node_modules

✓ routes

JS allusers.js

JS home.js

JS signin.js

JS signup.js

✓ utilities

JS userStorage.js

JS server.js

data : all user information

routes : each file has routing action

utilities : common functionalities

server.js : all routing

```
app.use(express.json());  
app.get("/allusers", allUsers);  
app.use("/signup", signUp);  
app.use("/signin", signIn);  
app.use("/home", home);
```

[Node-Express Server Overview]

```
const express = require("express");  
const router = express.Router();
```

```
router.post(  
  "/",  
  signUpValidations,  
  validationResponder,  
  checkEmailExistence,  
  hashPassword,  
  (req, res) => {  
    const { firstName, l
```

example of signup

```
router.get("/all-users", (req, res) => {  
  const usersPath = path.join(__dirname, "../data/users.json");
```

example of home

server.js

```
app.get("/allusers", allUsers);  
app.use("/signup", signUp);  
app.use("/signin", signIn);  
app.use("/home", home);
```

```
//importing Routes  
const allUsers = require("../routes/allusers");  
const signUp = require("../routes/signup");  
const signIn = require("../routes/signin");  
const home = require("../routes/home");
```

[Middleware Usage]

check email exists on signin

```
// Middleware to check if the email exists
const checkEmailExistance = (req, res, next) => {
  const submittedEmail = req.body.email;

  const existingUsers = getAllUsers();

  const userExist = existingUsers.find((user) => user.email === submittedEmail);

  if (!userExist) {
    const error = new Error("Email not found. Please try again or sign up.");
    error.status = 400;
    next(error);
  } else {
    req.user = userExist;
    next();
  }
};
```

[Middleware Usage]

check email exists on signin

```
// Middleware to check if the email exists
const checkEmailExistance = (req, res, next) => {
  const submittedEmail = req.body.email;

  const existingUsers = getAllUsers();

  const userExist = existingUsers.find((user) => user.email === submittedEmail);

  if (!userExist) {
    const error = new Error("Email not found. Please try again or sign up.");
    error.status = 400;
    next(error);
  } else {
    req.user = userExist;
    next();
  }
};
```

same name middleware on signup but slightly different action

[Middleware Usage]

signup

```
router.post(
  "/",
  signUpValidations,
  validationResponder,
  checkEmailExistence,
  hashPassword,
  (req, res) => {
    const { firstName, lastName
```

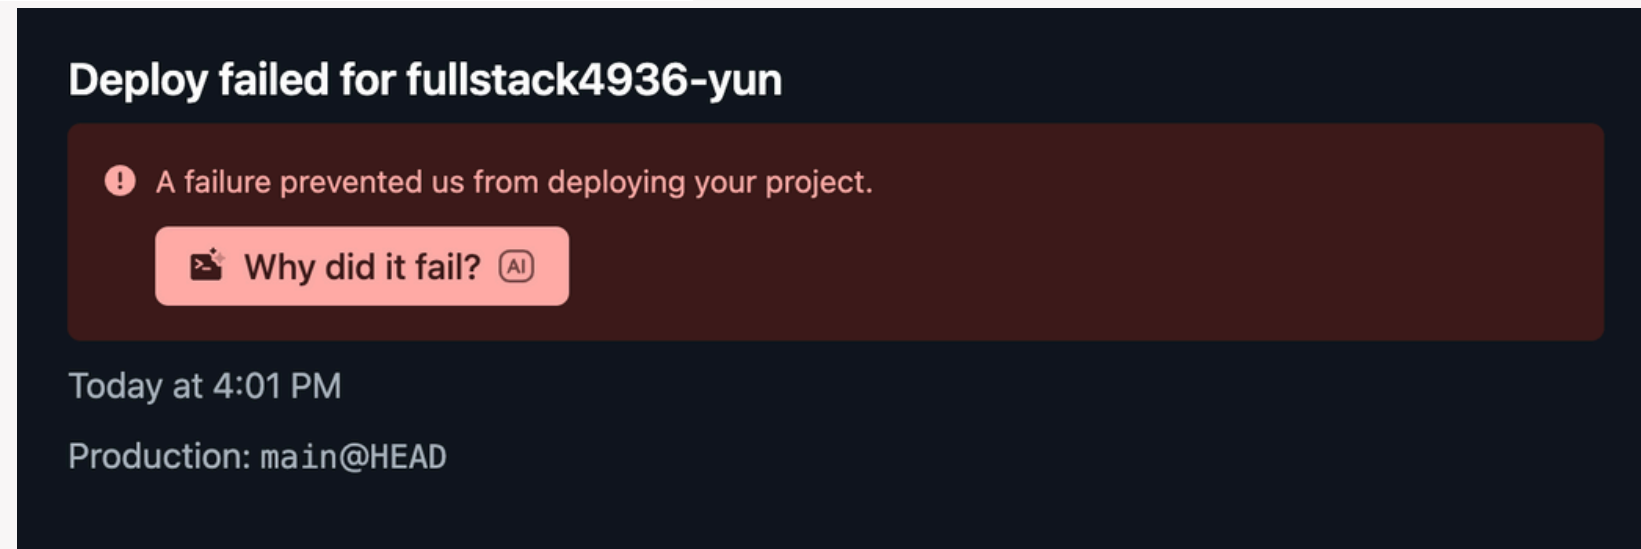

```
const signUpValidations = [
  body("firstName").notEmpty().withMessage("First name is required."),
  body("email").isEmail().withMessage("Invalid email"),
  body("password")
    .isLength({ min: 5 })
    .withMessage("Pass word should be at least 5 characters."),
  body("repassword")
    .custom((value, { req }) => value === req.body.password)
    .withMessage("Passwords do not match"),
];
```

signUpValidation is array for validations

[Middleware Usage]

Frontend : Netlify

Backend : Render

Environment Variables :
stored in .env.

.env is in .gitignore

set variables manually in Render
